Stage 1 · Background (situation diagnosis) · Internal document · Version 1.1 · October 12, 2026

AI-powered used-car appraisal for dealers

InfoCar is a mobile tool that, standing in front of the car and in under two minutes, tells a used-car dealer's buyer **the most they should pay** and **how much it will cost to make the car ready for sale**. It combines three sources: the market price of comparable cars, the condition visible in guided photos, and the typical faults of each model.

Founding team

Bruno Caro Maturana	CEO (also leads Sales and Growth)
Sebastián Ramírez Olmos	COO
Joaquín Parraud	CFO
Vicente Ramírez Almonacid	CTO
Daniel Cuero Mosquera	Head of Data and Pricing
Gabriel Marín Rocuant	Head of Product and Customer Experience
Moisés León Fuentes	Head of Technical Operations and Mechanics Network

Professor: Claudia Scherman B. · Industrial Engineering, UDD.

InfoCar is the app's name; the trademark still has to be registered with INAPI and the domain secured.

Document convention: [data] = figure with a cited source; [hypothesis] = assumption to be validated in the Stage 2 research.

Executive summary

The problem. A used-car dealer decides, car by car, how much to pay and how much repairs will cost, without a reliable market price and almost always without an in-house mechanic. Today it gets by checking listing sites, keeping spreadsheets and trusting the owner's eye. A single bad purchase can wipe out the margin of several good cars.[hypothesis]

The solution. InfoCar delivers on the phone a *maximum purchase price*, built as follows: market value based on comparables, *minus* the estimated repair cost (from guided photos and the fault database by model), *minus* a risk margin for what the photos cannot see. From that it issues a verdict: *Buy*, *Negotiate* or *Pass*. It also flags cars listed below their market price.

The customer. We decided to start with the **B2B segment**: small and medium independent used-car dealers that buy about 3 or more cars a month. Chile has 557 companies in that core (SII, 2024).[data] Private buyers (B2C) make 83.6 % of used-car purchases,[data] but they buy a car every few years and are expensive to acquire. They will be served in a second stage, once the product works for dealers.

The model. Monthly subscription: Basic Plan at CLP 60,000 and Pro Plan at CLP 150,000, anchored to the software that dealers already pay for (1.5 to 9 UF a month).[data] The AI cost per car assessed is below US$0.02,[data] so the relevant cost is people.

> **What the numbers show.** In the base scenario, **InfoCar** reaches 56 paying dealers by the end of 2029, with about CLP 67 million in annual recurring revenue (ARR). That covers a **minimum team** (about 31 customers), but **not** a technical team of two paid engineers (about 70 customers). That is why the roadmap ties every hire to a measurable milestone and keeps three levers open: raising revenue per customer, adding the B2C report and expanding to other regions. The assumptions that move the result the most are the **price per customer** and the **number of dealers that adopt**, so they are the focus of the market research (section 10).

Decision	What we decided and why
Main segment	B2B: small and medium independent used-car dealers (≥ 3 purchases a month). They face the problem most often and at the highest cost, and they pay on a recurring basis.
Product concept	**Merger**: the pricing engine from the Stage 1 v2 report becomes a module of the photo-inspection assistant. This reuses all previous work.
Initial geography	Santiago Metropolitan Region (RM): it concentrates 58 % of used-car transfers[data] and about half of the companies in the industry.[data]
What we do **not** do	We do not buy or sell cars, we do not certify, and we do not replace physical inspection. We are a pre-screening filter and a negotiation argument.
How we grow	Each phase has a measurable criterion to move forward (*stage gate*). No one is hired before revenue justifies it.

1 Business definition

1.1 Category and scope

InfoCar belongs to the **B2B automotive technology** (***autotech***) category, specifically to **AI-assisted appraisal and inspection for the used-car trade**. We do not compete with listing sites or with dealer management software: we come in at the moment before the purchase, when the buyer has to decide on a price.

Background item	Definition
Business category	Mobile SaaS for appraising and assessing the condition of used cars, for companies that buy cars to resell them.
History	Founded in 2026 as a project by seven Industrial Engineering students at UDD. The Stage 1 report (09-22-2026) validated the B2B price-intelligence space; this document adds photo-based condition assessment.
Current situation	Idea stage, validated with secondary information. There is no product, no customers and no field interviews yet.
Scope	Small and medium dealers in the Santiago Metropolitan Region, at the purchase decision. B2C and other regions follow (section 8).
Main actions	Stage 1 v2 market report, buyer persona and TAM/SAM/SOM with SII and CAVEM data, and this internal analysis.

1.2 The problem, in numbers

Evidence	**Source**
1,060,919 used-car transfers in 2025 (+5.8 %); 3.4 used cars sold for every new car.[data]	CAVEM via REDIMIN; Autofact
Companies buy 16.2 % of used cars (14,231 out of 87,748 in August 2026).[data]	PressLatam, citing CAVEM
The same model (Ford F-150) was listed in 2025 at between CLP 2.0 and CLP 68.9 million: without comparables, the price cannot be judged.[data]	Emol
"3 out of 4" used cars would have hidden faults or legal irregularities.[data] *Note: this figure is published by Carvuk, which sells inspections.*	Carvuk via the press (Jun. 2026)
An in-person pre-purchase inspection costs about CLP 44,990 per car and requires scheduling a visit.[data]	Carvuk

1.3 How the product works

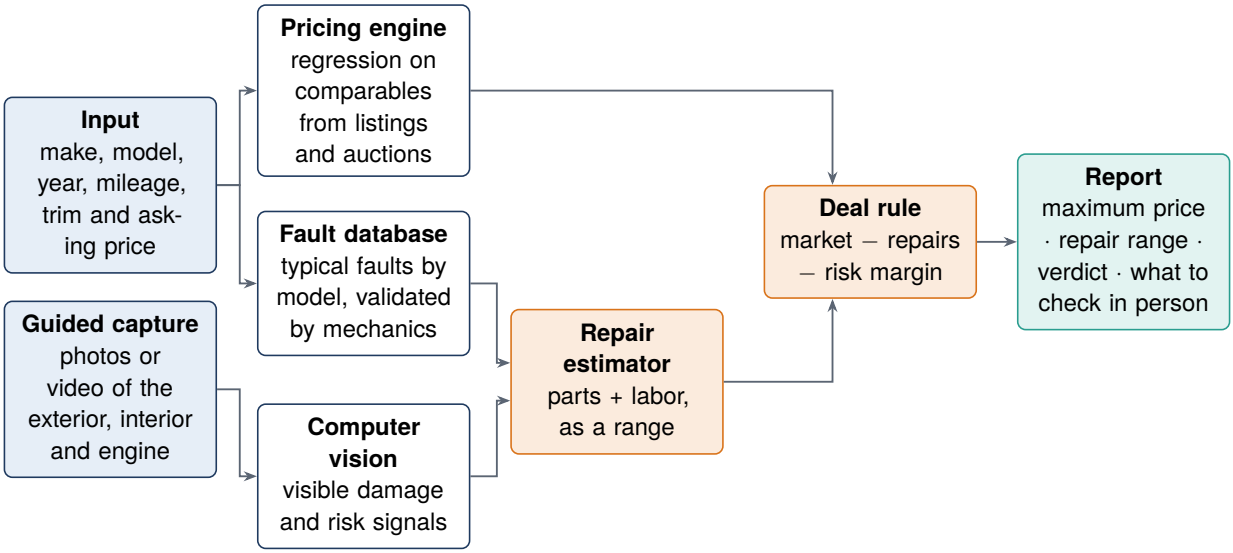

Figure 1: Flow of an assessment. The price is set by the regression, not by the language model: the LLM only structures the listing text and writes the explanation.

Deal rule (the core of the product).

$$\text{Maximum price} = \text{Market value} - \text{Estimated repairs} - \text{Risk margin}$$

Buy if the asking price is less than or equal to the maximum price. **Negotiate** if it exceeds it by up to a threshold (X %, calibrated in the validation phase). **Pass** if it exceeds that threshold or if a sign of a serious fault appears.

Stated product limit. Photos cannot see inside the engine, the gearbox or the chassis. **InfoCar** does not certify or replace physical inspection. Its job is to (a) rule out cars before paying for an inspection, (b) say what to check in person and (c) provide a numerical argument to negotiate. This limit appears in the report, the terms of use and the advertising, as required by Chile's Consumer Protection Law (Law No. 19,496).

2 Target customer

2.1 Ideal customer profile (ICP)

The profile was built from the problem: we asked who has it most often and at the highest cost.

Criterion	Target customer	Why it matters
Type of business	Independent used-car dealer that buys cars to resell them	Its margin depends on the purchase price and the repair cost
Volume	About 3 or more cars bought a month (sales of 10,000 to 100,000 UF a year)	With frequent purchases, a subscription is justified
Mechanic	No in-house mechanic or appraiser; relies on an outside shop or on their own eye[hypothesis]	This is the gap we fill
Sourcing	Trade-ins, listing sites, auctions and private sellers[hypothesis]	Photo capture works in all of them
Digital habits	Already lists on online marketplaces and uses the phone daily; can pay for management software[data]	No need to change the way they work

Out of focus for now: large groups and importers (250 companies, with their own appraisal), micro-businesses and companies with no sales (2,966, with very little volume), and private buyers, who will be addressed after the B2B product is validated.

SII bracket (2024)	Sales (UF/year)	Companies	Estimated purchases a month	Priority
Small 1	2,400–5,000	281	under 1.4	Broad
Small 2	5,000–10,000	271	1.4–2.7	Extended
Small 3	10,000–25,000	314	2.7–6.8	**Core**
Medium 1	25,000–50,000	149	6.8–13.5	**Core**
Medium 2	50,000–100,000	94	13.5–27	**Core**
Core		**557**		
Core + extended + broad (SAM)		1,109		

Source: SII, company statistics, activity 451 (sale of motor vehicles), 2024 tax year. Monthly purchases are estimated as sales ÷ (UF × average purchase of CLP 12 million), so they are upper bounds: activity 451 also includes new cars and other revenue.

2.2 Buyer persona: Camilo, owner of a mid-sized dealership

> *"I know a good car when I see one, but I can't open every hood. If someone else gets there first, I lose the deal. If I get it wrong, I eat the repair."*

Profile. Owner and main buyer of a dealership in Greater Santiago. He buys and sells about 7 cars a month (about 25,000 UF in sales a year) with a team of 6.[data] He is around 45, has more than 15 years in the trade and learned it on the lot, not in the workshop.[hypothesis]

Typical week. Browses Chileautos and Yapo looking for cars below market, compares prices by hand in a spreadsheet, takes cars as trade-ins, goes to auctions when he runs short of stock and pays for management software.

How he decides. He acts when a car with a hidden fault goes wrong or when he loses several good deals in a row. He asks other owners, tries the tool for free on his next purchase and compares it with what he already pays. He decides alone, pays by card and wants to be able to cancel at any time.

Adopts if...	Rejects if...
It gives a maximum price and repair range in under 2 minutes in front of the car	It takes time to set up or the team needs training
Estimates match the workshop invoice during the trial	It gets it badly wrong, even once or twice
It costs less than one mistake per quarter	It costs as much as his management software

Camilo is a composite, illustrative character built on the core profile. His name, age and anecdotes are invented; figures marked [data] come from the SII, CAVEM and the market report.

2.3 The job the customer hires us for (*Jobs to Be Done*)

> ***When** a private seller offers me their car or I see a lot at an auction, **I want** to know quickly how much it will cost to make it ready for sale and what I can sell it for, **so I can** buy only the cars that leave me a margin.*

Dimension	What it means for Camilo
Functional	Decide whether to buy and at what price, without opening the hood.
Emotional	Peace of mind: not feeling cheated or having to "eat" a repair.
Social	The dealership's reputation: not selling cars with faults and looking professional to customers. Having the whole team appraise with the same criteria.

3 Value proposition

3.1 Value Proposition Canvas: dealer

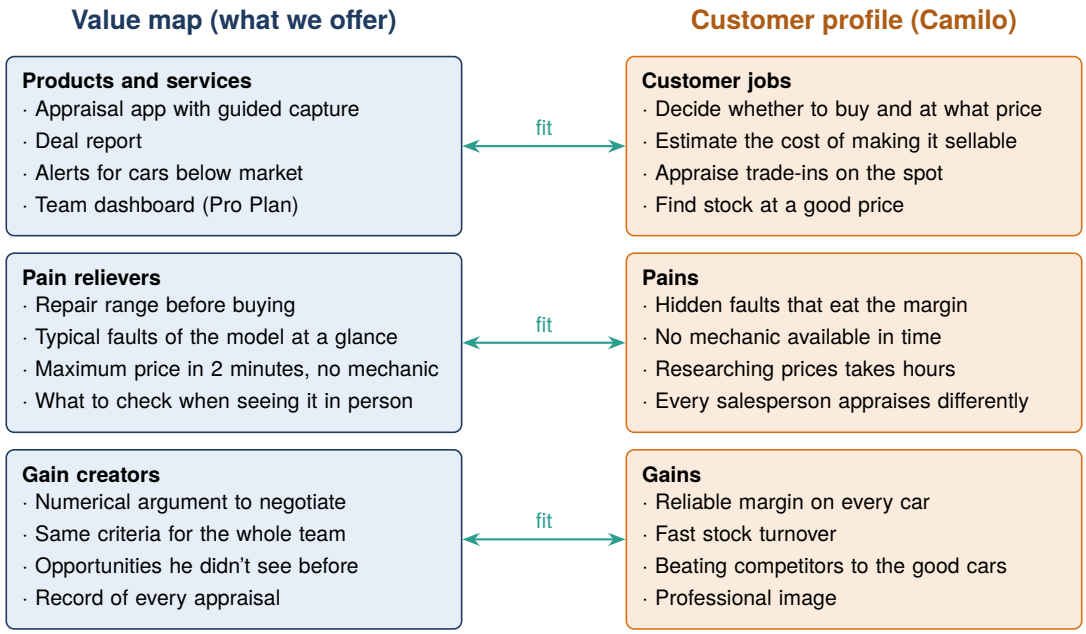

Figure 2: Value Proposition Canvas (Osterwalder et al., 2014). The customer side was completed first, and the offer was designed afterwards.

3.2 Against the next best alternative

Anderson, Narus and van Rossum (2006) recommend a *resonating focus* value proposition: a few differentiators that matter to the customer, that can be demonstrated and that are stated in the customer's language. To do that, we first have to name what the customer uses today.

Alternative	What it solves	What it doesn't solve	Our difference
Own eye and spreadsheet	Fast and free	Inconsistent; misses the model's typical faults	Single set of criteria and a data-based price
Outside mechanic or workshop	Physical diagnosis	Must be scheduled, costs money and gives no market price	Available instantly, with price and repairs
Carvuk (in-person pre-purchase)	100- to 150-point physical and legal inspection	About CLP 45 thousand per car, with a visit	Pre-screening: only the car that passes gets inspected
AutoGest (AI appraiser)	Appraises by make, model, year, mileage and region; CLP 59,990 a month	Uses neither photos nor a fault database	Adjusts for visible condition and typical faults
Autofact / Autofact Pro	Legal history and market value	Does not assess physical condition or repairs	Physical condition and repair cost
Ofertautos	Price alerts for consumers (CLP 4,990)	Built for private buyers; doesn't look at the specific car	Built for companies and for the specific car

3.3 Positioning statement

Positioning (G. Moore's template). For **used-car dealers who buy several cars a month without an in-house mechanic**, **InfoCar** is an **AI appraiser on the phone** that, in front of the car and in under two minutes, gives the **maximum purchase price and the range of the repair cost**. Unlike a data-only appraiser or an in-person inspection, it **adjusts the price for the actual condition visible in photos and for the model's typical faults**, and it costs less than one bad purchase per quarter.

3.4 Quantified value for the customer

Component (a Camilo-type dealer, per month)	**CLP**
Loss avoided: one fewer CLP 300,000 mistake per quarter[hypothesis]	100,000
Appraisal time saved: 7 cars × 1 hour × CLP 10,000 per hour[hypothesis]	70,000
Gross value delivered	**170,000**
Basic Plan price	−60,000
Net value for the customer (about 2.8 times what they pay)	**110,000**

Customer break-even: at CLP 60,000 a month, the subscription pays for itself if it prevents one CLP 300,000 mistake every five months. The actual cost of a bad purchase will be asked in the interviews.

4 Business model

4.1 Business Model Canvas

Key partners

· Network of mechanics who validate the fault database and the estimates
· Workshops with parts and labor rates
· Auctions (Reyco, Vedisa) and listing sites with data licenses
· Dealer software (GEMA, Vendicar) for integration
· AI and cloud providers (Chile region)
· UDD Ventures and CORFO: mentoring and funding

Key activities

· Maintain and validate the fault database by model
· Train and calibrate the pricing and vision models
· Compare estimates with real invoices
· Field sales and onboarding

Key resources

· Price dataset (listings and auctions)
· Fault database and repair cost table
· Pricing and vision models
· Team with data, software and sales skills

Value proposition

B2B: "Know how much to pay and how much it will cost to fix before you shake hands."

· Maximum purchase price in under 2 minutes in front of the car
· Repair cost range from photos and the model's faults
· Verdict: buy, negotiate or pass
· Alerts for cars below market
· Same criteria for the whole team

B2C (phase 3): "Before you pay, know whether the car is worth the asking price."

Customer relationships

· 14-day free trial
· Assisted on-site onboarding
· Support via WhatsApp (industry norm)
· Monthly accuracy report to the customer

Channels

· Direct sales to dealers in the RM
· Presence at auctions
· Integration with dealer software
· Monthly "price index" for the press
· Mobile web app (no installation)

Customer segments

Primary (years 1–2): small and medium independent dealers, with ≥ 3 purchases a month. Core of 557 companies; 1,109 including the extended segment.

Secondary (phase 3): private buyers without a trusted mechanic.

Out of focus: large groups and importers.

Cost structure

· People: the main cost (semi-senior full-stack developer CLP 1.8 to 2.8 million; data scientist CLP 2.8 to 4.2 million a month)
· Cloud and AI: about US$100 to 200 a month; under US$0.02 per car assessed
· Mechanic validations (paid per validation) · customer acquisition (CAC) · outside legal and accounting

Revenue streams

· B2B subscription: Basic CLP 60,000 a month; Pro CLP 150,000 a month; Enterprise on quote
· Individual B2C report (phase 3): CLP 7,990
· Future options: referral fee from workshops (disclosed), partnerships with insurers and lenders
· All prices are hypotheses and will be validated by the research

Business Model Canvas (Osterwalder and Pigneur, 2010). Compared with the Stage 1 v2 report, four blocks change: the value proposition adds the adjustment for photos and faults; partners add the mechanics network; activities add validation against real invoices; and prices drop to fit the small and medium core.

4.2 Plans and pricing

	Basic	Pro	Enterprise
For whom	Small dealer (Small 3)	Medium dealer (Medium 1 and 2)	Groups with several branches
Monthly price[hypothesis]	CLP 60,000	CLP 150,000	On quote
Users	1	Up to 5	Unlimited
Appraisals	Up to 40 a month	Unlimited	Unlimited
Includes	Maximum price, repair range, verdict	+ auction alerts, team dashboard and history	+ integration with their software
Market anchor[data]	AutoGest CLP 59,990	Vendicar 1.5 to 9 UF; GEMA from CLP 99,900	—

4.3 Profit formula (unit economics)

Johnson, Christensen and Kagermann (2008) define the business model as value proposition, profit formula, key resources and key processes. The profit formula for the B2B segment is as follows:

Metric (B2B)	Pessimistic	Base	Optimistic
Average revenue per account (ARPA), CLP a month	43,100	99,300	203,400
Gross margin (AI, validations, payment gateway)[hypothesis]	90 %	90 %	90 %
Monthly churn[hypothesis]	5 %	3 %	2 %
Average customer lifetime (1 ÷ churn), months	20	33	50
LTV = ARPA × margin × lifetime, CLP	776,000	2,978,000	9,153,000
CAC (field visit + trial)[hypothesis], CLP	400,000	400,000	400,000
LTV / CAC (healthy if ≥ 3)	**1.9**	**7.4**	**22.9**
Months to recover CAC (healthy if ≤ 12)	10.3	4.5	2.2

ARPA = core mix: 314 dealers on Basic and 243 on Pro, at low, base and high prices. Health thresholds per David Skok (SaaS Metrics 2.0). In the pessimistic scenario the unit economics are **not healthy**: that is the risk the pricing research has to rule out.

5 Mission, vision and values

We used the structure of Collins and Porras (1996): a *core ideology* that does not change (purpose and values) and an *envisioned future* (a bold goal with a deadline). To turn the vision into strategy we used the hierarchy of Collis and Rukstad (2008).

Purpose · Buying a used car should stop being a gamble.

Mission · We give every used-car dealer a reliable maximum purchase price for each car, combining the market, the actual condition shown in its photos and the model's typical faults, so that every purchase leaves a margin.

Vision · That in Chile no used car changes hands without the buyer knowing what it is worth and what it will cost them.

Big Hairy Audacious Goal (BHAG) for 2035 · 1 in 5 used cars bought by companies in Chile will have gone through InfoCar first (about 35,000 a year, based on company purchases in 2025).

5.1 Values with observable behaviors

Value	Behavior that shows it
Transparency	We always show a range, how the verdict was calculated and what we cannot see in photos.
Rigor	Every estimate is compared with the actual workshop invoice, and we share our accuracy with the customer every month.
Closeness to the trade	We validate on the dealer's lot, not in the office, and we speak the buyer's language.
Data care	We only store vehicle data; we blur license plates and never store sellers' names or phone numbers.
Learning fast	No feature goes into development without a hypothesis and a metric to validate it.

5.2 Strategy statement (Collis and Rukstad)

Objective, scope and advantage. **Objective:** 56 paying dealers and CLP 67 million in annual recurring revenue by December 2029 (base scenario). **Scope:** small and medium independent dealers, first in the Santiago Metropolitan Region, at the purchase decision. We do not buy or sell cars and we do not certify. **Advantage:** we are the only tool that combines a multi-source market price, an adjustment for the condition visible in photos and a fault database by model, in under two minutes and on the phone.

5.3 Quality tests applied

Test	Result
Industry benchmark	Autofact ("eliminate information asymmetry"), Kavak and CarGurus ("trust and transparency") talk about trust and speak to the consumer. Our mission speaks to the business and to one concrete decision: the purchase price.
Replacement test	If "InfoCar" is swapped for a competitor, the mission stops being true: none of them combines photos, faults and market data.
Decision test	It helps us say no: we don't sell cars, we don't certify and we don't serve large groups first.
Hallway test	The mission fits in about 15 seconds and the vision in one sentence.

6 Team and org chart

6.1 The founding team

We are seven students in the final year of Industrial Engineering at UDD, and five of us are also pursuing a double degree. All of us have been teaching assistants, so we are used to explaining things clearly and working to fixed deadlines. We come from internships in banking, mining, technology and services, and roles were assigned based on what each of us already does well and where each of us wants to grow.

6.2 Current org chart (stage 0: validation)

According to Mintzberg, a startup begins as a *simple structure*: a strong strategic apex, little formalization and almost no middle line. Galbraith adds that structure follows strategy. That is why the roles come from the activities in the business model and the value chain (section 6.4).

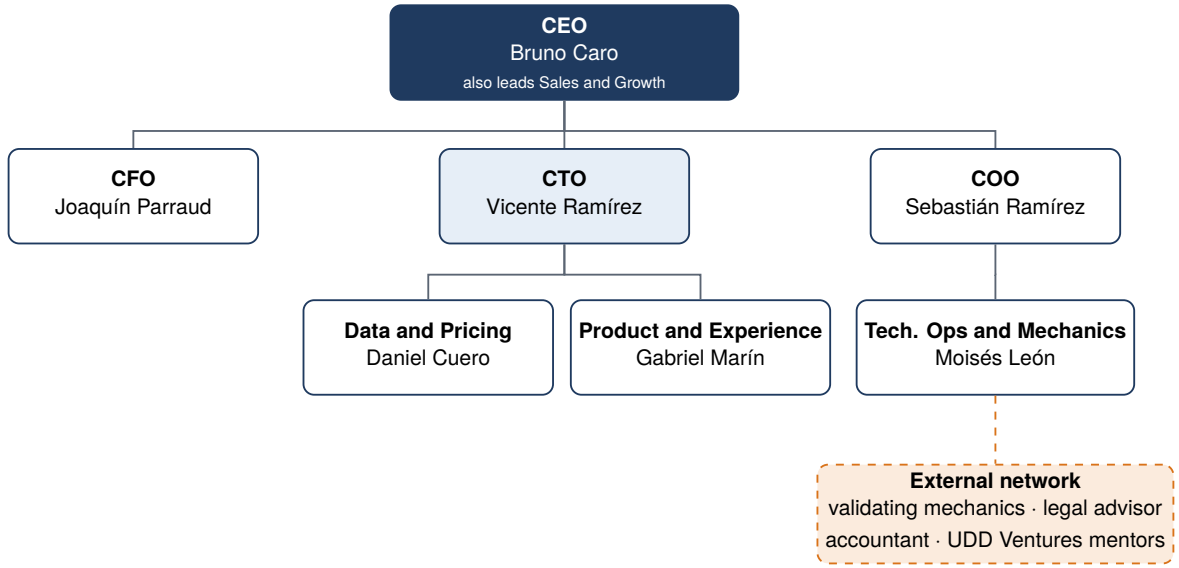

Figure 3: Stage 0 org chart (October 2026 to March 2027). All founders work part-time and unpaid.

6.3 Org chart in stages 1 and 2

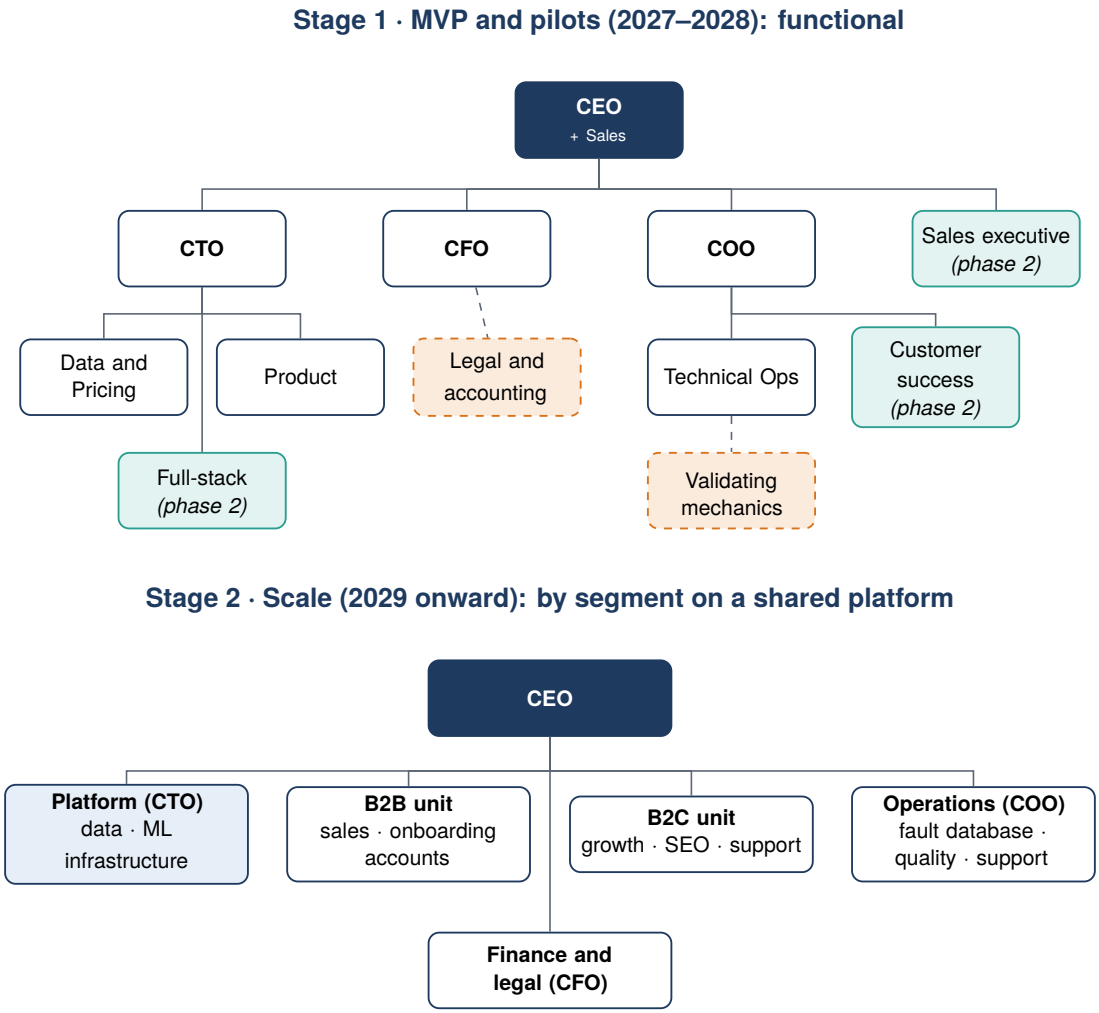

Figure 4: In stage 1 the structure is functional: efficient and specialized. In stage 2 it moves to units by segment, because B2B and B2C buy for different reasons, on top of a common technology platform that serves both units internally. Operations (COO) sets the quality standards for the estimates.

6.4 From the value chain to roles

Activity (Porter)	At **InfoCar**	Owner
Inbound logistics	Capturing licensed listings and auction data, parts prices and users' photos	Daniel Cuero
Operations	Pricing and vision models, and the deal rule	Vicente Ramírez and Daniel Cuero
Outbound logistics	Delivering the report in the mobile web app	Gabriel Marín
Marketing and sales	Field sales, auctions, partnerships, price index for the press	Bruno Caro
Service	Onboarding, WhatsApp support and complaints	Sebastián Ramírez and Gabriel Marín
***Support:* technology**	Fault database validated by mechanics	Moisés León
***Support:* infrastructure and finance**	Budget, metrics, pricing, legal and accounting	Joaquín Parraud
***Support:* management and people**	Strategy, partners and investors; internal processes and coordination	Bruno Caro (management) and Sebastián Ramírez (processes)

6.5 RACI matrix for critical processes

Process	Seba	Daniel	Vicente	Bruno	Gabriel	Joaquín	Moisés
Update the fault database for a model	C	C	C	I	I	–	**A**/R
Train and calibrate the pricing model	–	**A**/R	C	I	I	–	C
Validate accuracy against a real invoice	C	R	R	I	I	–	**A**
Launch a new feature	C	C	R	C	**A**	I	C
Close a sale with a dealer	C	–	–	**A**/R	C	C	–
Respond to a complaint about a wrong estimate	**A**	R	C	I	R	I	R
Approve an expense or a hire	C	–	C	**A**	–	R	–
Prepare the monthly metrics report	C	C	C	I	C	**A**/R	C

R = responsible (does the work) · A = accountable (only one per process) · C = consulted · I = informed.

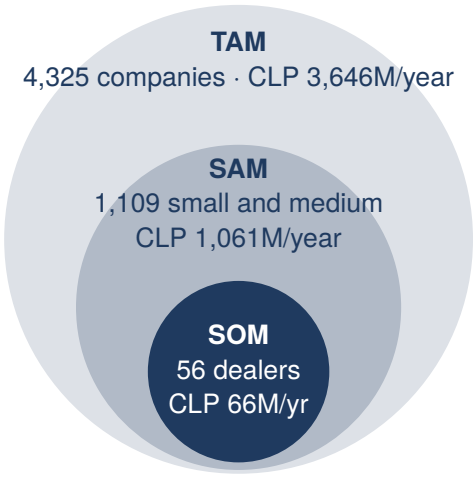

6.6 Headcount and costs by stage

Role	Joins in	Commitment	Gross monthly cost
Seven founders	Stage 0	Part-time, unpaid[hypothesis]	—
Validating mechanics (external)	Stage 0	Per validation	CLP 25,000 per validation[hypothesis]
Semi-senior full-stack developer	Phase 2 milestone	Full-time	CLP 1.8 to 2.8M[data]
Semi-senior data scientist / ML	Phase 2 milestone (optimistic)	Full-time	CLP 2.8 to 4.2M[data]
B2B sales executive	Phase 2	Full-time	To be quoted
Legal and accounting	Stage 0	External	To be quoted

Salaries: IT Workers 2026 guide, Santiago, 25th to 75th percentiles (cited in the Stage 1 v2 report). Hiring rule: a role is hired only when monthly recurring revenue exceeds 1.2 times its cost.

7 Market and projections

7.1 TAM, SAM and SOM

TAM: all companies in SII activity 451 (2024), with micro and small companies at the Basic price and medium and large ones at the Pro price. It is a theoretical ceiling.

SAM: 866 small companies at the Basic price and 243 medium ones at the Pro price.

SOM (3 years): 10 % of the 557 core companies. That is about 6 % of the SAM and under 2 % of the TAM. Range: 28 to 111 companies (CLP 14 to 272M).

Figure 5: Bottom-up sizing: number of companies × annual subscription price (base scenario). By transactions, there were 1,060,919 used-car purchases in 2025, of which companies made about 172,000.

An honest reading of the market. At these prices, the dealer niche in Chile is small: the base SOM is about CLP 66 million a year. That is why the plan includes three growth levers, each in a phase of the roadmap: more revenue per customer (Pro and Enterprise plans), the B2C report, and expansion to other regions and then to other countries. Activity 451 includes new-car dealerships, so the real SAM is probably smaller; a request to the SII for codes 451001 and 451002 would clarify it.

7.2 Projection assumptions

Assumption	Pessimistic	Base	Optimistic
Basic / Pro price (CLP a month)	30,000 / 60,000	60,000 / 150,000	90,000 / 350,000
Paying dealers at Dec. 2027 / 2028 / 2029	4 / 14 / 28	8 / 30 / 56	15 / 60 / 111
Core penetration at 3 years	5 %	10 %	20 %
Monthly churn	5 %	3 %	2 %
B2C reports in 2029 × price	500 × 4,990	1,500 × 7,990	4,000 × 9,990

All assumptions are hypotheses. Billing starts in October 2027, after six months of free pilots. The model is monthly: new sign-ups are calculated to reach each year's target after deducting churn.

7.3 Results in three scenarios

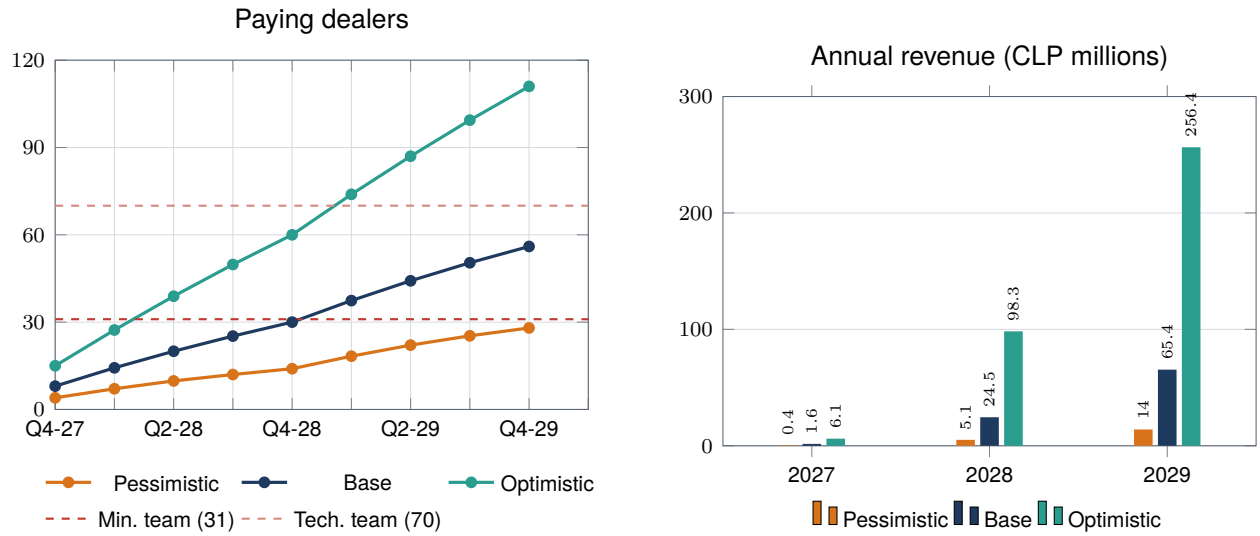

Figure 6: Left: paying dealers at the end of each quarter, with the break-even lines for two team configurations. Right: annual revenue (2029 includes the B2C report).

CLP millions	Pessimistic	Base	Optimistic
Revenue 2027 (Oct.–Dec.)	0.4	1.6	6.1
Revenue 2028	5.1	24.5	98.3
Revenue 2029 (subscriptions + B2C)	14.0	65.4	256.4
Subscription ARR at Dec. 2029	**14.5**	**66.7**	**271.0**

7.4 Break-even by team configuration

Configuration	Fixed cost a month	Customers to break even	When is it reached?
Minimum team: cloud and AI + validations + 1 full-stack	CLP 2.75M	31	Base: early 2029 · Optimistic: Q2 2028
Technical team: 2 paid engineers (Stage 1 v2)	CLP 6.25M	70	Base: after 2029 · Optimistic: Q1 2029
Full stage 1: + sales executive + customer success	CLP 8.75M	98	Only in the optimistic scenario (Q3 2029)

Customers to break even = fixed cost ÷ (base ARPA of CLP 99,300 × 90 % gross margin). Unpaid founders are an assumption for the early phases and are **not** sustainable over time.

7.5 Sensitivity: what moves the result

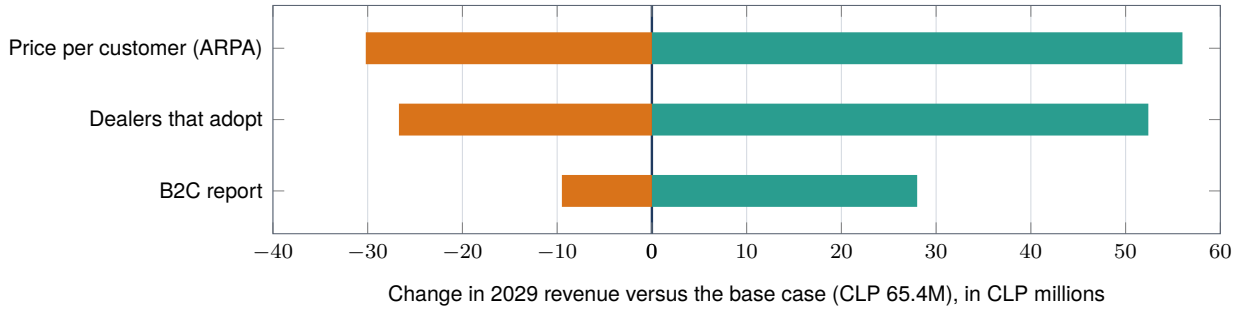

Figure 7: Sensitivity of 2029 revenue when each variable takes its pessimistic (orange) or optimistic (green) value and the rest stay at base.

Implication for the research. The two assumptions that move the result the most are the **price a dealer is willing to pay** and the **share of dealers that would adopt** the tool. That is why they are the priority specific objectives of Stage 2.

8 Business roadmap

The roadmap follows three frameworks. *Product Roadmaps Relaunched* (Lombardo et al., 2017): it is organized by outcomes, with firm dates only in the short term. McKinsey's three horizons: core, emerging businesses and future options, with timelines compressed for a startup. And *Build–Measure–Learn* (Ries, 2011): each phase validates a hypothesis before investing in the next one.

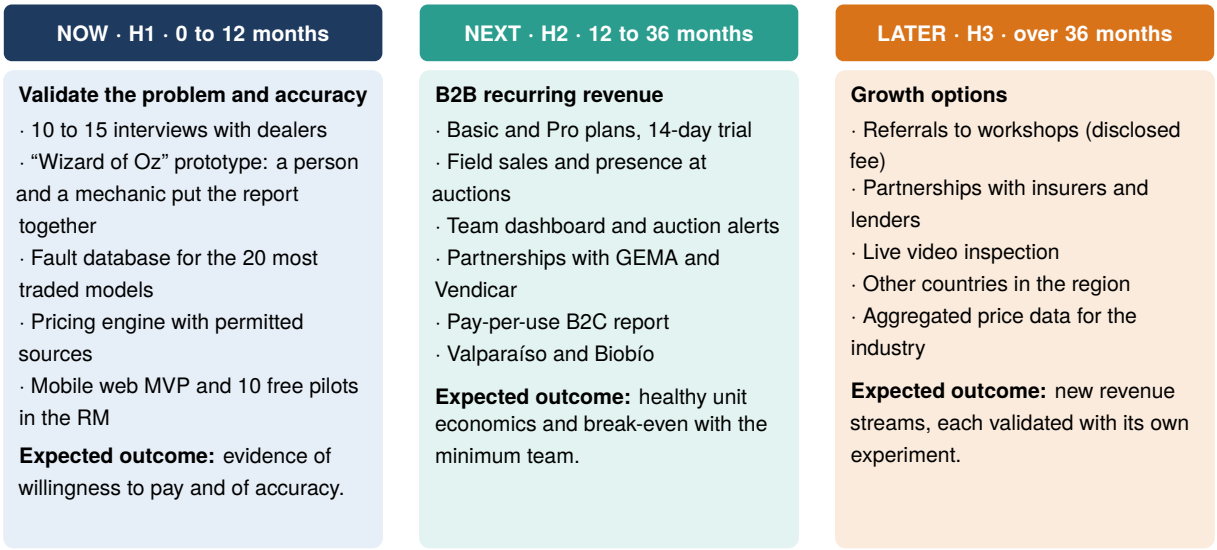

Figure 8: Roadmap by horizon (*Now* / *Next* / *Later* format).

8.1 Phases and criteria to move forward

Phase	What gets built	Measurable criterion to move to the next phase
0 · Validation Oct. 2026 – Mar. 2027	Interviews, "Wizard of Oz" prototype, top-20 fault database, incorporation and terms of use (Law No. 21,719)	≥ 30 appraisals checked against a mechanic with value error $\leq 15\,\%$ · ≥ 5 of 10 dealers say they would pay $\geq$ CLP 60,000 · ≥ 3 letters of intent
1 · MVP and pilots Apr. – Sep. 2027	Mobile web app, pricing engine, guided capture, repair estimator, 10 free pilots	≥ 10 pilots with ≥ 8 appraisals a month · the real invoice falls within the range in $\geq 70\,\%$ of cases · ≥ 6 pilots convert to paid
2 · B2B commercialization Oct. 2027 – Dec. 2028	Paid plans, field sales, partnerships with software and auctions, team dashboard	≥ 30 paying customers · churn $\leq 3\,\%$ a month · LTV/CAC ≥ 3 · full-stack hire
3 · Scale 2029	B2C report, Valparaíso and Biobío, Enterprise plan	≥ 56 customers · B2C revenue $\geq$ CLP 1M a month · decision on a second engineer
4 · Options 2030 onward	Workshops, insurers, lenders, other countries	Each option is validated with its own experiment before investing

8.2 Business Gantt chart

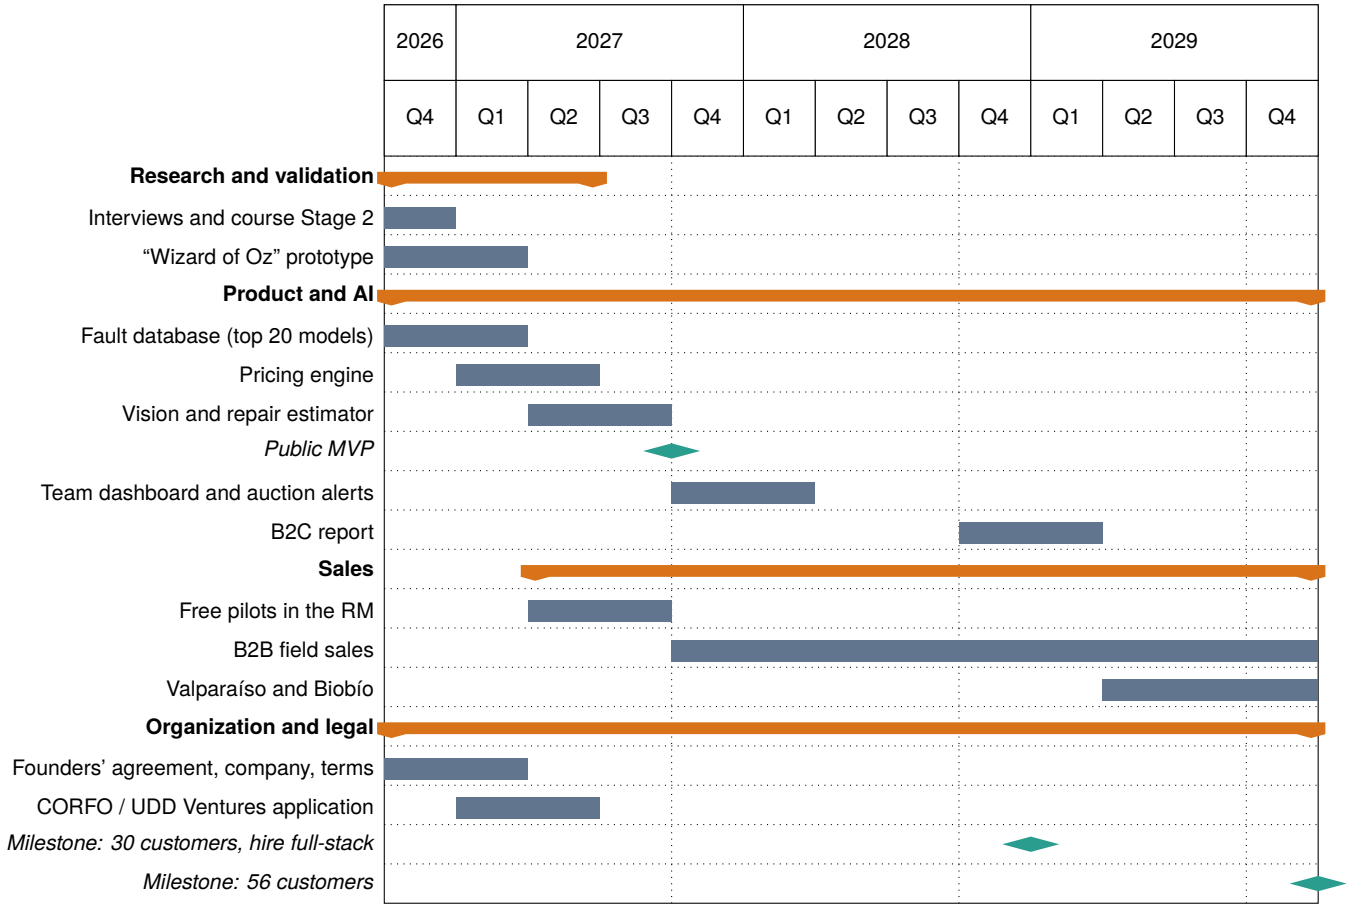

Figure 9: Gantt chart by quarter. Dates after 2027 are indicative and depend on passing each milestone.

8.3 Funding the early phases

Phases 0 and 1 require little cash, because the founders are unpaid and the cloud costs about US$100 to 200 a month. The main expenses are mechanic validations (about 300 a year at CLP 25,000 each, i.e., about CLP 7.5 million), incorporation and legal advice, and field operations. The sources to evaluate are CORFO grants for early-stage ventures, UDD Ventures incubation and university competition funds. Current amounts and deadlines must be checked before applying.

9 Risks and mitigation

Risk	Level	Mitigation	Owner
Wrong estimates that damage trust	High	Always show a range; compare it with real invoices; publish accuracy; state the limits (Law No. 19,496)	Daniel Cuero
Small domestic market	High	Pro and Enterprise plans, B2C report, other regions and then other countries; hires tied to milestones	Bruno Caro
Data access: Chileautos and Mercado Libre prohibit automated scraping	Medium	Start with permitted sources (Yapo, auctions, the customer's own stock); negotiate licenses	Vicente Ramírez
Personal data (Law No. 21,719, in force from 12-1-2026)	Medium	Store only vehicle data; blur license plates in photos; privacy policy from day 1	Joaquín Parraud
A competitor (AutoGest, Carvuk) copies the photo feature	Medium	The advantage lies in the validated fault database and the accuracy track record, which take time; move fast in the RM	Gabriel Marín
Seven founders with uneven commitment	Medium	Founders' agreement with vesting; RACI with a single owner per process; monthly review	Bruno Caro
Unreliable mechanics network	Low	Pay-per-validation contracts; at least two mechanics per category; cross-audits	Moisés León

10 From hypotheses to research objectives

Every element of this document leaves hypotheses behind. The riskiest are those that move the projections the most or that, if false, invalidate the value proposition. Those hypotheses become the Stage 2 research objectives, following the course rules (*Target&Chain*, ch. X): the general objective is written in the infinitive and names the phenomenon, without saying who or where, and without method verbs such as "measure" or "apply".

> **General objective (draft).** To evaluate the perceived value of an AI-assisted appraisal tool in the purchase decision for used cars intended for resale.

#	Specific objective	Hypothesis it tests	Decision it enables
1	To describe the current appraisal and purchase decision process	The owner decides alone, in minutes and without a mechanic	Design of the flow and of the main user
2	To identify the costs and consequences of a bad purchase	A mistake costs about CLP 300,000 or more	Value message and price
3	To analyze the alternatives used today and how they are valued	The outside mechanic and one's own eye are the status quo	Positioning against the alternative
4	To evaluate trust in a condition estimate made from photographs	They trust it if a range and the accuracy are shown	Report format and required accuracy level
5	To identify willingness to pay and the preferred billing format	CLP 60,000 to 150,000 a month as a subscription	Plans and pricing (most sensitive assumption)
6	To identify the attributes that trigger adoption or rejection	Speed, accuracy and zero setup	MVP priorities and adoption targets

Commercial and marketing objectives in SMART format are developed formally in Stages 3 and 4, after the SWOT and the PESTEL. Draft commercial objective: reach 30 paying dealers in the Santiago Metropolitan Region by 12-31-2028, with monthly churn below 3 %.

11 Internal team work plan

For the rest of the term the team is organized into two groups: **five members research the market** and **two define the internal side** (this document and the projections). The assignment builds on what each person will later do at **InfoCar**.

Member	Task in the course	Deliverable
Internal group (2)		
Sebastián Ramírez	Coordinates, integrates this document into the slide deck and looks after the storytelling and course terminology	Consolidated deck
Joaquín Parraud	Projections, break-even and sensitivity; assumptions with their sources	Projection spreadsheet
Market group (5)		
Bruno Caro	TAM-SAM-SOM with SII and CAVEM; request codes 451001 and 451002 from the SII	Updated sizing
Daniel Cuero	Used-car sales channels and willingness to pay by segment	Pricing and segment table
Gabriel Marín	Competitors, substitutes and international benchmarks (Carvuk, AutoGest, UVeye, Ravin, ProovStation)	Competitive map
Vicente Ramírez	AI adoption in Chile and hallucinations: why a dedicated tool and not a general chatbot	Technical argument slide
Moisés León	Legal framework (Laws No. 19,496 and 21,719), agencies, and contact with workshops and dealers for interviews	Contact list and legal framework

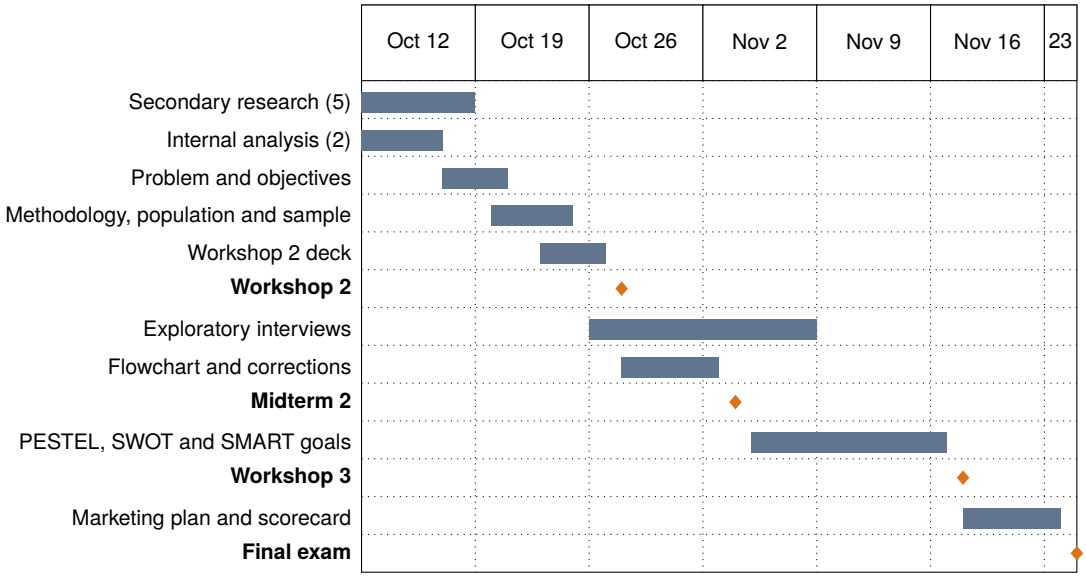

Figure 10: Work plan from October 12 to November 24, 2026. Each deliverable is submitted as a PDF before class and incorporates the feedback on the previous one.

Course rules this plan follows. Deliverables are cumulative and self-explanatory. Every member must be able to explain any figure or concept that appears in them. The terminology is the course's: background, buyer persona, value chain, SWOT, PESTEL, SMART, general objective and specific objectives. Sourced figures are cited in footnotes and assumptions are presented as hypotheses.

11.1 Immediate to-dos

- Register the "InfoCar" trademark with INAPI and secure the domain.
- Run 5 to 8 quick interviews with dealers to validate the JTBD, the cost of a mistake and the price range.
- Confirm the current prices of Carvuk and AutoGest, and find the original source of the MTT figure on technical inspection failures.
- Get a quote for the cost of a mechanic validation and the salary of a B2B sales executive.
- Request from the SII the breakdown of codes 451001 and 451002 to refine the SAM.
- Agree on each founder's commitment and the draft founders' agreement.

A Frameworks used

Element	Framework and author	Where it is used
Value proposition	Jobs to Be Done (Christensen et al., HBR 2016); Value Proposition Canvas (Osterwalder et al., 2014); resonating focus (Anderson, Narus and van Rossum, HBR 2006); positioning (Moore, *Crossing the Chasm*)	Sections 2 and 3
Business model	Business Model Canvas (Osterwalder and Pigneur, 2010); four-box model (Johnson, Christensen and Kagermann, HBR 2008); two-sided markets (Eisenmann, Parker and Van Alstyne, HBR 2006)	Section 4
Mission and vision	Core ideology and BHAG (Collins and Porras, HBR 1996); objective, scope and advantage (Collis and Rukstad, HBR 2008); *Start with Why* (Sinek, 2009)	Section 5
Organization	Simple structure (Mintzberg, 1980); Star Model (Galbraith); value chain (Porter); RACI matrix	Section 6
Projections	Bottom-up TAM/SAM/SOM; SaaS metrics: LTV/CAC ≥ 3 and CAC payback ≤ 12 months (Skok)	Section 7
Roadmap	*Product Roadmaps Relaunched* (Lombardo et al., 2017); three horizons (Baghai, Coley and White); *The Lean Startup* (Ries, 2011)	Section 8
Objectives	*Target&Chain*, ch. X (Scherman, UDD 2026)	Section 10

B Data sources

- SII. Company statistics by industry, sub-industry 451 "Sale of motor vehicles", by sales bracket and region, 2024 tax year (spreadsheet `SIIVentaVehiculos.xlsx`).
- CAVEM, via REDIMIN and the 2025 Yearbook: used-car transfers by region and age; company purchases for July and August 2026 (via PressLatam).
- Team report *Stage 1 Background – Market Research Report v2* (09-22-2026): prices of dealer software (Vendicar, GEMA, AutoGest, Ofertautos), AI and cloud costs, salaries (IT Workers 2026 guide), listing sites' terms of use and Law No. 21,719.
- Team document *Buyer persona and TAM SAM SOM* (October 2026): ideal customer profile, buyer persona and sizing.
- Carvuk, via g5noticias and descubre.vc (June 2026): pre-purchase inspection price and study on hidden faults.
- Emol (2025): price dispersion on Chileautos.
- Course material: *Strategic Marketing* Docs 1 to 4 and *Target&Chain*, ch. X, Prof. Claudia Scherman B., UDD 2026.
